2. Manual Drainage Assessment

Review the uploaded image and select the most visible condition.

Visible Drainage Condition

Standing Water

 Analyze Drainage Condition

Assessment Result

Priority Score

80/100

Inspection Priority

HIGH

Asset

DR-001

Detected Visible Condition

Standing Water

Score Breakdown

Visual condition: 30 points

Rainfall context: 20 points

Historical waterlogging: 30 points

Recommended Action

Elevated inspection priority. Physical inspection is recommended to verify the visible drainage condition and downstream flow.

Maintenance Guidance & Field Checklist

Assessment: Standing Water | **Priority:** HIGH (80/100)

Condition-specific maintenance

- Check grate clearance and look for visible sediment or debris around the inlet.
- Inspect the downstream outlet or channel for flow restriction without entering it.
- Record water depth and duration if known, then escalate recurring ponding for field review.

Weather and history checks

- Prioritize verification while conditions are safe and monitor nearby pooling or overflow.
- Escalate recurring waterlogging for a broader catchment and downstream capacity review.

Safety and close-out

- Never enter the drain or remove a secured cover as part of this screening.
- Photograph the condition before and after safe surface maintenance, and log the time and asset ID.
- Physical inspection is required before ordering maintenance; this checklist does not confirm underground blockage.

DR-001

Detected Visible Condition

Solid Waste / Plastic

Score Breakdown

Visual condition: 25 points

Rainfall context: 10 points

Historical waterlogging: 30 points

Recommended Action

Elevated inspection priority. Physical inspection is recommended to verify the visible drainage condition and downstream flow.

Maintenance Guidance & Field Checklist

Assessment: Solid Waste / Plastic | **Priority:** HIGH (65/100)

Condition-specific maintenance

- Remove accessible plastic and solid waste using gloves and appropriate PPE.
- Inspect the grate bars and curb opening for lodged material that restricts flow.
- Document the waste type and location so recurring dumping can be reported.

Weather and history checks

- Recheck flow during rainfall and note whether the opening handles incoming runoff.
- Escalate recurring waterlogging for a broader catchment and downstream capacity review.

Safety and close-out

- Never enter the drain or remove a secured cover as part of this screening.
- Photograph the condition before and after safe surface maintenance, and log the time and asset ID.
- Physical inspection is required before ordering maintenance; this checklist does not confirm underground blockage.
